

Electronic Appendix 1. List of *Allium oleraceum* localities with geographical coordinates and basic descriptive data. DNA-ploidy level of plants was assessed using flow-cytometry. Number of analysed individuals with respective ploidy level within a population is shown. Ploidy level records labelled with asterisks were also determined by direct counting from mitotic cells. Habitat types were coded by number 1–7 as follows: 1 = rock, 2 = dry grasslands, 3 = mesic & wet grassland, 4 = (semi)natural forest, 5 = scrub, 6 = planted *Robinia pseudacacia* forest, 7 = arable field & field margins. In the case of population inhabiting two or more adjacent habitats, codes of respective habitats are mentioned, separated by comma. Variable 'anthropic impact' was coded by numbers 0 and 1 as follows: 0 = 'human-impacted' vegetation; 1 = 'natural' vegetation. See Materials and methods for explanations.
