

Vít P., Wolfová K., Urfus T., Tájek P. & Suda J. (2014): Interspecific hybridization between rare and common plant congeners inferred from genome size data: assessing the threat to the Czech serpentine endemic *Cerastium alsinifolium* (Caryophyllaceae). – Preslia 86/1: 95-117.

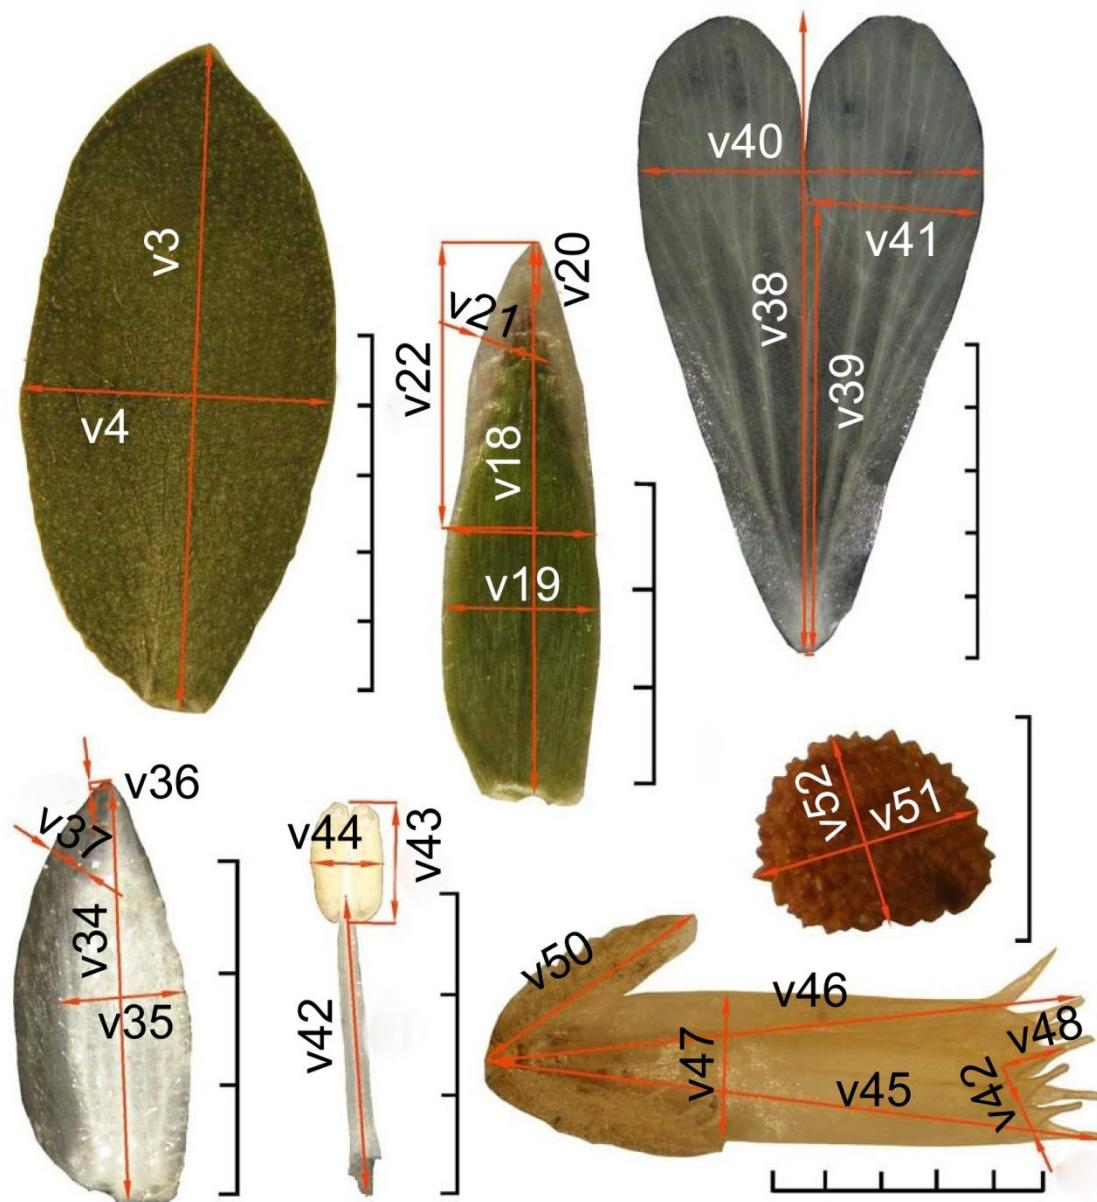

Electronic Appendix 1. – Locality details of studied *Cerastium* populations in the Czech Republic and the location of sampling sites in the Slavkovský les Mts. in western Bohemia. Intensive sampling was done over the entire range of five serpentine localities in the Slavkovský les Mts. (see the map below), geographic co-ordinates therefore refer only to one particular microsite within the locality. Borders of nature reserves are shown in the map: 1 – Křížky, 2 – Dominova skalka, 3 – Vlček, 4 – Pluhův Bor, 5 – Planý vrch.

Locality description	Latitude (°N)	Longitude (°E)	Altitude (m a.s.l.)	No. of samples
<i>Cerastium alsinifolium, C. arvense, interspecific hybrids</i>				
W Bohemia, Slavkovský les: Nová Ves, Dominova skalka serpentine rock	50.0714775	12.7863617	745	516
W Bohemia, Slavkovský les: Prameny, Křížky serpentine rock	50.0657283	12.7495978	810	452

Electronic Appendix 2. – Pictures of individual plant parts (leaf, bract, petal, sepal, stamen, capsule, and seed) with superimposed variables (see Table 1). The bar represents 1 mm.

Electronic Appendix 3. – Canonical discriminant analysis of 616 *Cerastium* samples classified into three groups (*C. alsinifolium*, *C. arvense*, interspecific hybrids) using 69 characters (see Table 1 for character description; character v41 was excluded due to its very tight correlation with v40). *C. alsinifolium* – red, *C. arvense* – blue, F1 hybrids – green, polyploid hybrids – black. Samples from open rocky outcrops and (semi)shaded forest habitats are depicted by circles and squares, respectively. Diamonds denote samples of *C. arvense* outside the Slavkovský les Mts. The first and the second canonical axes explain 79.5% and 18.5% of the total variation, respectively.

Relative contributions of individual characters to canonical axes. Ten and five canonical correlates with the highest absolute loadings on the first and the second canonical axes, respectively, are highlighted in bold type face. Numbers in parentheses are ranks of the strength of the correlation of each variable with the canonical axes. See Table 1 for character description.

Electronic Appendix 4. – A modified determination key (with data on pollen fertility) for large-flowered *Cerastium* plants occurring in the Slavkovský les Mts. Values of quantitative characters are expressed as (minimum–) 5 percentile – 95 percentile (–maximum).

- 1a Pollen fertility high (more than 70% of stainable grains) 2
- 1b Pollen fertility considerably reduced (less than 60% of stainable grains) *C. alsinifolium* × *C. arvense*
- 2a Median and upper cauline leaves (2.5–) 3.6–10.2 (–14.7)-times longer than broad, (6.6–) 9.6–22.2 (–29.6) mm long, sterile shoots in leaf axils usually well-developed, (0–) 2–10 (–14) in number, scarious margin of the lowermost bract (1.1–) 1.7–4.2 (–4.9) mm long, always reaching beyond the apical third (usually considerably further), scarious margin of the second lowermost bract (0.8–) 1.6–3.6 (–4.8) mm long, calyx (excluding the scarious margin) (3.7–) 4.2–5.9 (–6.9) mm long, petals (7.0–) 7.9–11.6 (–12.6) mm long, anthers (0.6–) 0.9–1.3 (–1.4) mm long, capsule (1.1–) 1.3–2.2 (–2.6)-times longer than calyx, plants of comparatively dry and open habitats *C. arvense* L.
- 1b Median and upper cauline leaves (1.2–) 1.6–3.7 (–5.3)-times longer than broad, (2.7–) 4.7–12.2 (–19.4) mm long, sterile shoots in leaf axils lacking or a few (usually less than 3), scarious margin of the lowermost bract indistinct, 0–1.8 (–2.7) mm long, mostly confined to the apical third of the bract (rarely reaches its bottom half), scarious margin of the second lowermost bract (0–) 0.2–2.2 (–2.8) mm long, calyx (excluding the scarious margin) (2.6–) 3.0–4.6 (–5.1) mm long, petals (5.6–) 6.4–9.1 (–10.3) mm long, anthers (0.5–) 0.6–1.0 (–1.2) mm long, capsule (1.1–) 1.6–3.2 (–3.6)-times longer than calyx, plants of moist and (semi-)shaded habitats, usually in spring areas in spruce forests *C. alsinifolium* Tausch

Electronic Appendix 5. – Linear discriminant functions for the classification of large-flowered *Cerastium* plants in the Slavkovský les Mts. (see Table 1 for character description). Quantitative values should be measured with an accuracy of tenths of a millimetre. The higher function value indicates the most likely taxonomic assignment.
