

Supplementary Fig. S4. Morphological analysis: graphical representations of results. Bar plots of selected qualitative morphological traits recorded across different genetically delimited clades of the genus *Aneura* in Slovenia (n = 55). Each bar represents the number of specimens exhibiting a given character state. A Chi-square test revealed significant variation in the states of translucent and undulated thallus margin across taxa ($p < 0.05$).

Rhizoids coloured

$p = 0.2723$

Small, thread-like branches

$p = 0.00014$
